## ABOUT US

Despite entering a market that has seen the emergence of many companies that can supply the mining industry reflective products in sticker, traffolyte and metal form, Mine Signs has reinvented it's market. Mine Signs differentiated itself from the traditional sign companies in all business aspects, and created a whole new market within the reflective sign industry. Rather than providing a product for which supply already existed, it used innovation and creativity to create supply and demand for a new product and service that meets and exceeds Australian Standards.

The "Mine Sign Spec" will help customers maximise production, significantly reduce sign and label costs, avoid simple in-service failures and keep assets available for productive service.

## THE SIGNAGE PROBLEMS:

- Poor sign durability due to fading, cracking and peeling.
- Poor sign visibility due to the environment in which the signs are expected to perform.
- Compromised safety due to fading, cracking and peeling.
- Increased replacement costs.
- Time lag for replacement signage has caused machine down time and loss of production.
- Possible machine stand down due to sign failure

## DURABILITY CHART

Reference: BMA machine ID improvements test
